SUMMARY

B.Tech Computer Science student building a career in data analytics, with hands-on experience applying Python, SQL, Excel, and Power BI to real-world problems. Built machine learning projects covering fraud risk scoring, churn prediction, and phishing classification, translating raw data into actionable decisions. Completed a Data Analyst Job Simulation to apply core analytics workflows in a practical setting.

TECHNICAL SKILLS

- Languages: Python (Pandas, NumPy, Scikit-learn), SQL
- BI & Reporting: Power BI, Excel
- Machine Learning: XGBoost, SHAP, Classification Models, Computer Vision, NLP
- Tools: Git, GitHub, Flask

PROJECTS

Riskora — AI-Powered Payment Risk & Fraud Decisioning

- Built an AI-powered payment risk platform combining XGBoost, rule-based logic, and SHAP to detect fraud and score transactions.
- Enabled explainable, data-driven decisioning by surfacing SHAP-based feature importance behind each risk score.

Sentient Retention Engine

May 2026 – Present

- Built a production-grade agentic AI platform to predict and prevent SaaS customer churn.
- Combined machine learning with autonomous decision-making agents and Digital Twin simulations to generate churn-prevention insights.

PhishGuard

Oct 2025 – Dec 2025

- Built a machine learning-based phishing detection system that classifies emails, messages, and URLs using language and link pattern analysis.
- Combined XGBoost, computer vision, and NLP techniques to achieve high accuracy with low false positives.

WORK EXPERIENCE

Cyber Security Intern — Internselite (Virtual)

Mar 2024 – Jun 2024

- Performed threat analysis to identify security vulnerabilities and recommend mitigation strategies.
- Conducted network scanning and reconnaissance using Nmap to assess network security and identify exposed services.

EDUCATION

B.Tech, Computer Science & Engineering — Jai Narain College of Technology (JNCT), Bhopal

2023 – 2027

CGPA: 7.20 / 10

CERTIFICATIONS & TRAININGS

Data Analyst Job Simulation — OneRoadmap

Sep 2026

- Cleaned and validated a 5,150-row sales dataset — removed duplicates, standardized date/city/product formats, handled missing values, and converted mixed-currency revenue fields into a 4,820-record analysis-ready dataset.
- Analyzed revenue by region, calculated month-on-month growth, and evaluated sales channel performance to answer business questions from a simulated COO.
- Recommended channel strategy by weighing revenue trajectory, order volume, and average order value instead of total revenue alone.

AI, ML & Data Science — Wipro

Jun 2026 – Present
